

Setting it up

I wanted to have a lot of freedom and personal touch to my website, so I decided to code by hand and use libraries. I used Visual Studio Code to write the code making the development seamless.

Uploaded my website code to github to make it easy to connect to the web and

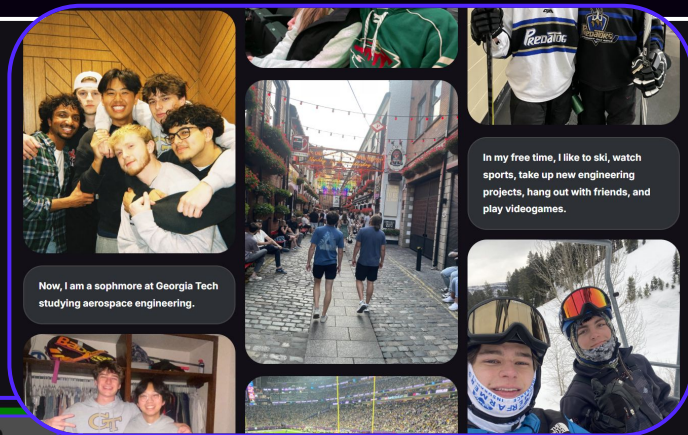

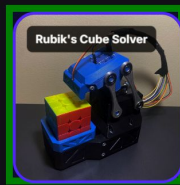

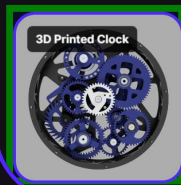

easy to access code from anywhere. I also developed the code using the react framework to allow for as much control over the site as possible.

Features

I utilized the React Bits library for many features, but had to make changes to the components to fit my page. I changed the library's tilted card component to work with a scalable grid for my projects section.

```
.projects-grid {  
  display: grid;  
  grid-template-columns: repeat(auto-fit, minmax(20vw, 1fr));  
  gap: 2vw 0;  
  margin: 2vw 4vw;  
  padding: 0;  
  justify-items: center;  
}  
  
/* Project Card Wrapper */  
.projects-grid > div {  
  cursor: pointer;  
  transition: transform 0.2s ease;  
}
```

Another component I made was this masonry image/text component above. Making this, I learned it's easier to take the time to set up the component than simply hard code it.
